What We'll Cover

1

DavinTrade at a Glance

The product, and the growth engine built around it

2

Inside the Product

A quick look at the live app affiliates are promoting

3

The Money Pipeline

Four business parts, one transaction boundary — money-service

4

How It All Connects

The end-to-end workflow, and where Rise fits in

5

Why Global Payouts Are Hard

The compliance problem we chose not to build ourselves

6

Why Rise

The platform our disbursement engine is already built around

7

What We've Already Built

Engineering depth — not a roadmap promise

8

The Ask & Next Steps

What we need from Rise today to go live

DavinTrade at a Glance

DavinTrade is a SaaS trading-alerts platform built around XAUUSD (Gold) — real-time technical alerts, chart drawing tools, and tiered subscriptions for retail traders. Growth runs through a referral affiliate program: affiliates bring in subscribers, and are paid a commission on every conversion.

XAUUSD

Single-symbol gold specialist product

2

Global payment rails — Stripe + dLocal

8

Local-currency markets served (dLocal)

Global

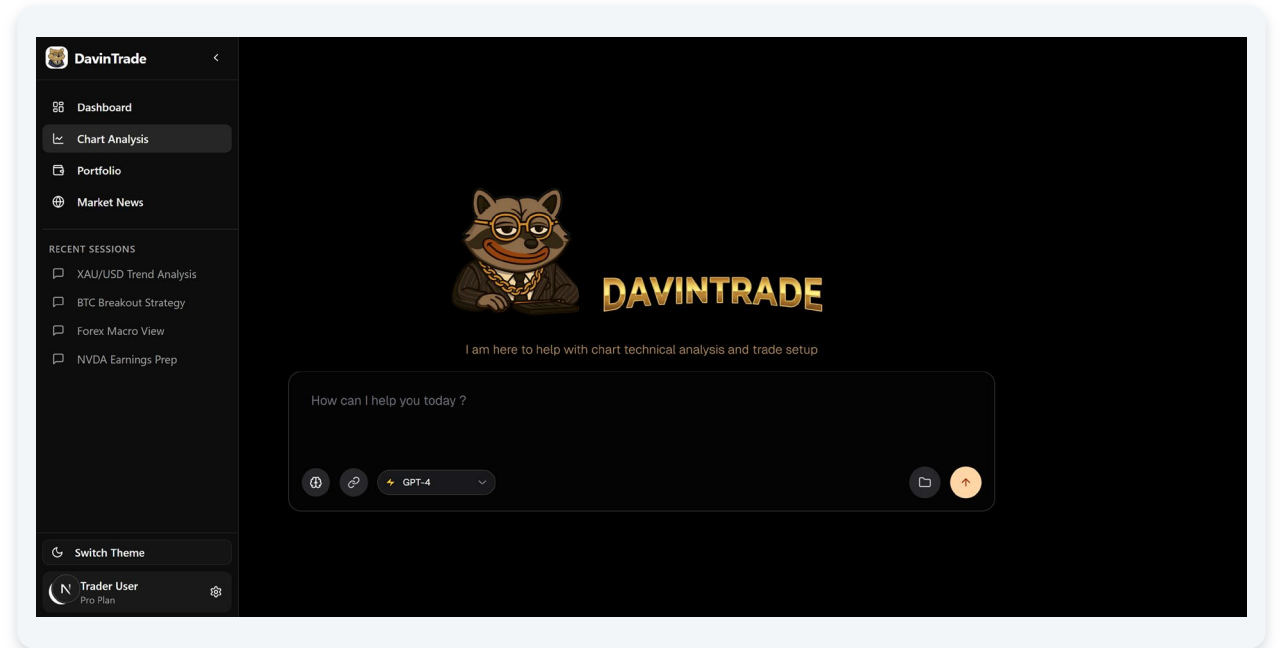

Affiliate network, paid where they live

That referral engine is the reason this partnership matters: every new affiliate we sign is a new payee who needs to be paid, reliably, in their own currency.

Inside the Product — Meet DavinTrade

Every affiliate-referred trader lands here first — a conversational, AI-first entry point, not a static dashboard.

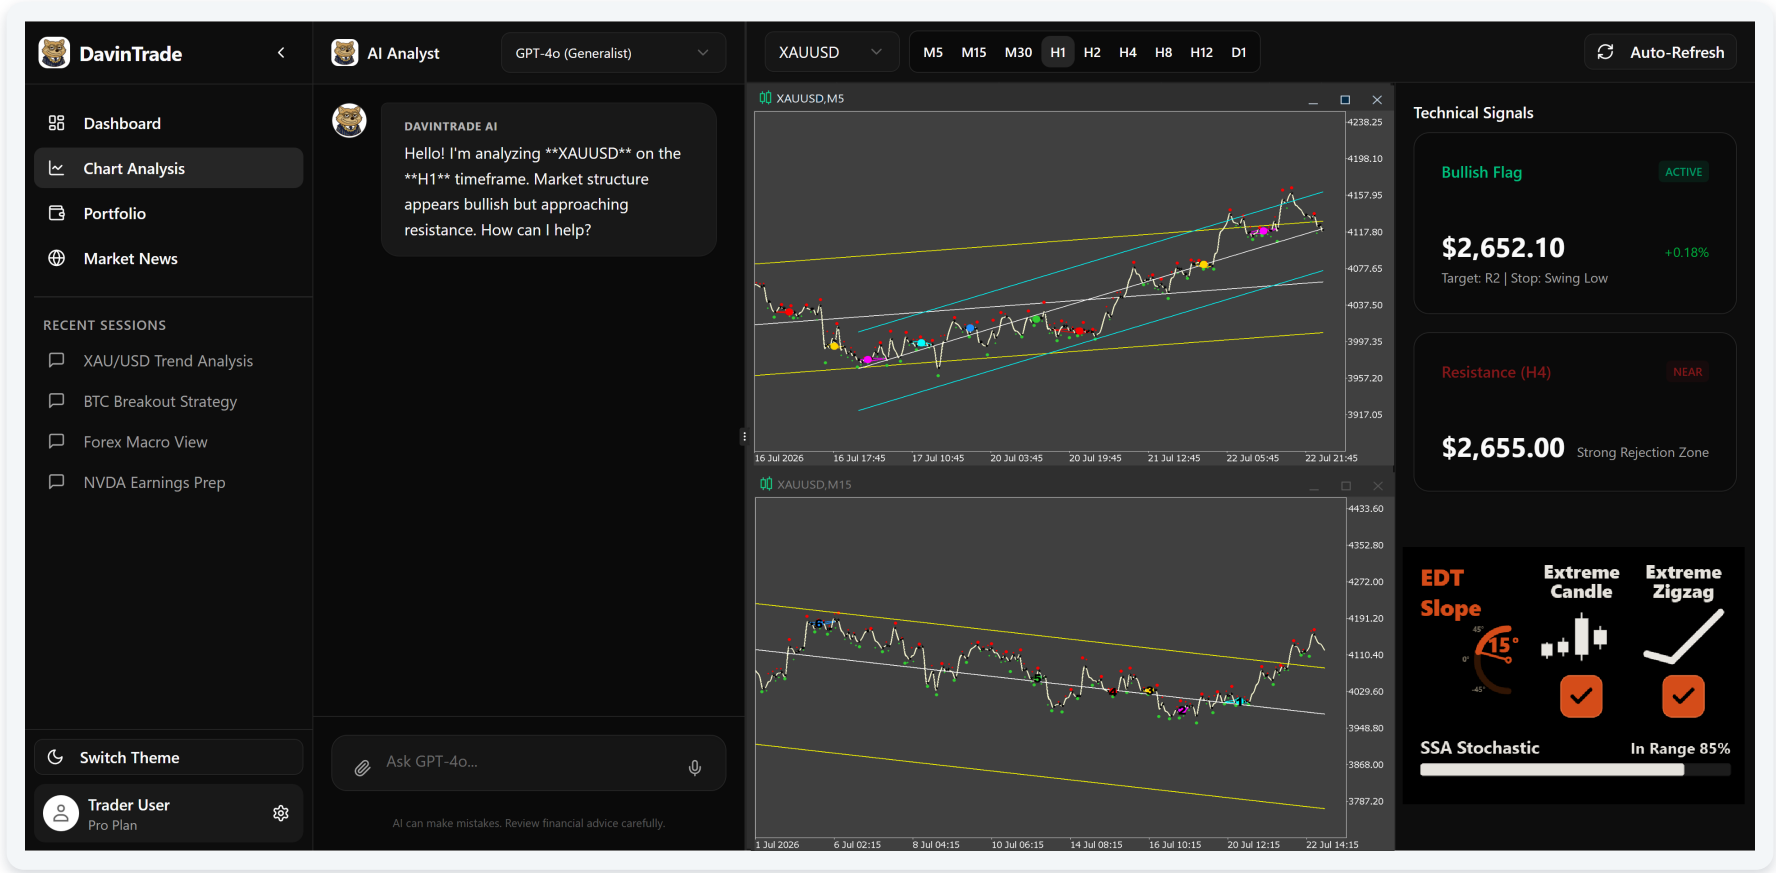

- ✓ **Chat-first onboarding**
Traders open a conversation with DavinTrade's AI, not a menu of settings.
- ✓ **Session history, saved**
Past analyses are kept and revisited anytime
(Remark : XAUUSD is only symbol initially launched in introductory phase while Cryptos, Forex, equities would be added in later phases).
- ✓ **Subscription tier, visible in-product**
The “Pro Plan” badge ties directly to the Stripe/dLocal billing covered earlier.
- ✓ **Simple, focused navigation**
Dashboard, Chart Analysis, Portfolio, and Market News — nothing extraneous.

DavinTrade's AI-first landing & chat page

Inside the Product — Live Analysis in Action

The Chart Analysis workspace pairs a symbol-aware AI Analyst with live, multi-timeframe XAUUSD charts and a proprietary signal engine — trend channels, a Bullish Flag pattern alert with a live price target, a flagged resistance level, and custom indicators (EDT Slope, Extreme Candle, Extreme Zigzag, SSA Stochastic) surfaced in real time.

The Money Pipeline — Four Parts, One System

Everything below lives in one purpose-built backend microservice: money-service (NestJS, on Railway).

12

Billing (Stripe)

Global card checkout, subscriptions, cancellations, invoices.

17

Affiliate

Referral codes, commission engine, payout eligibility, reporting.

18

dLocal Payments

Local payment methods across 8 emerging markets, fraud checks.

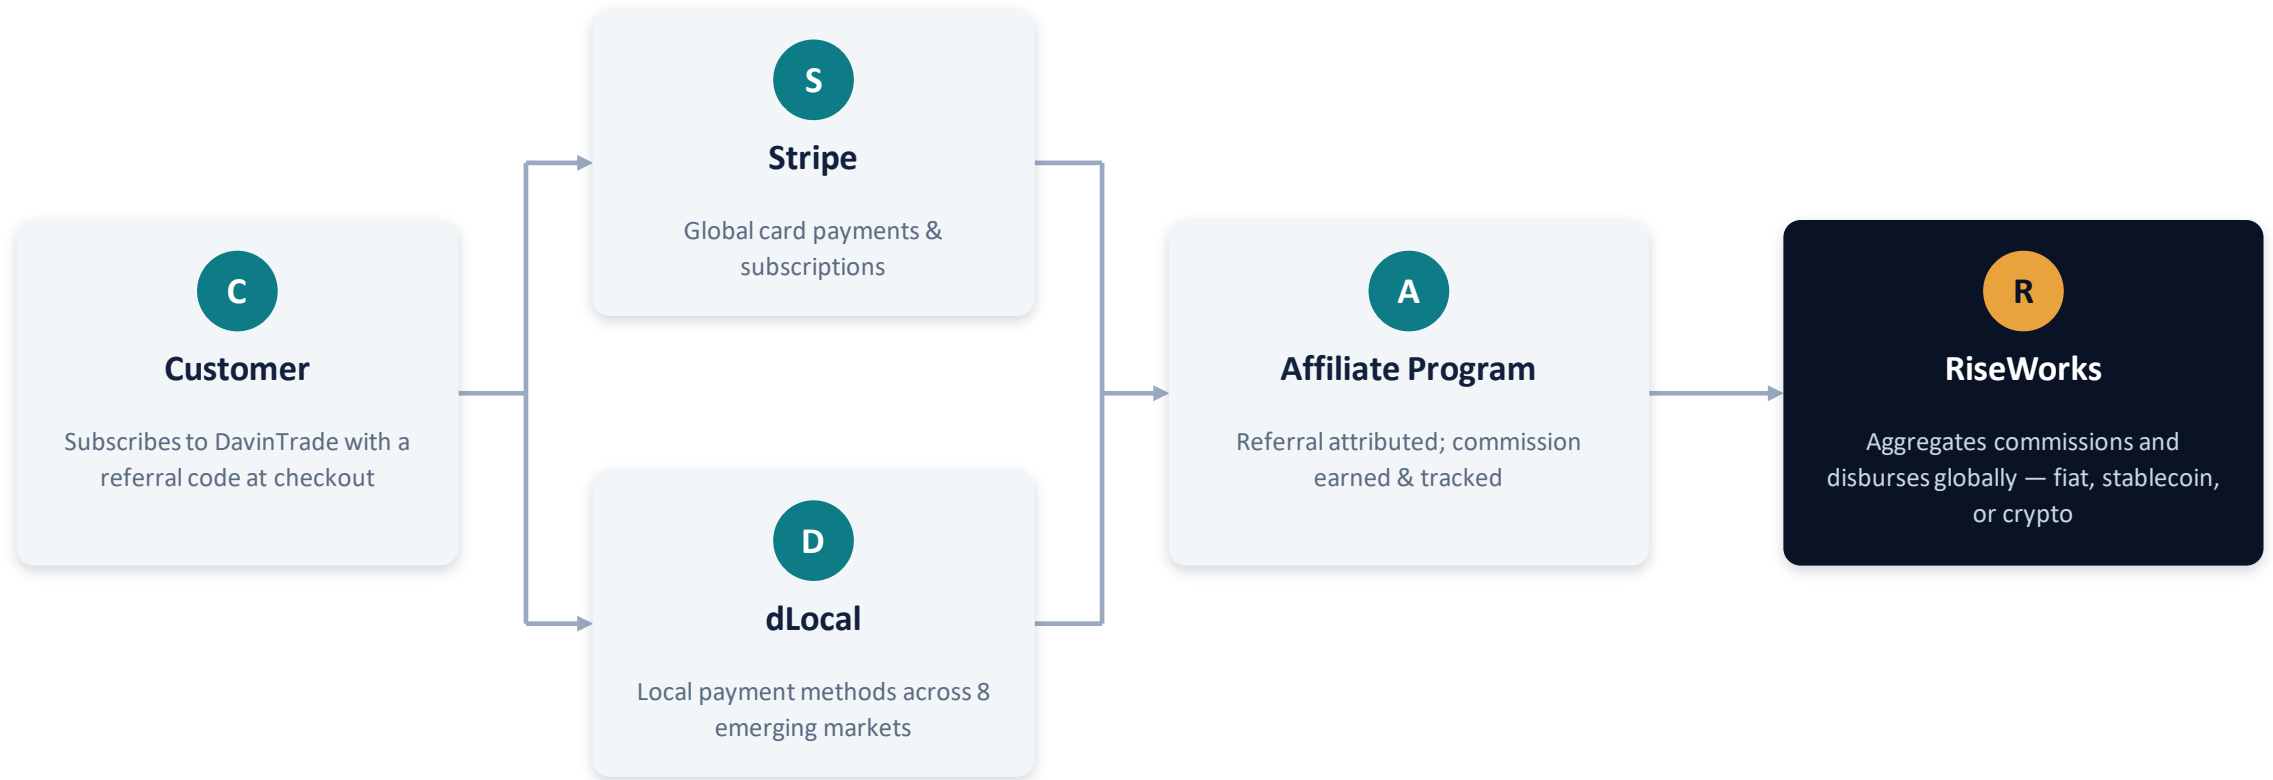

19

RiseWorks Disbursement

Batches affiliate commissions and pays them out globally via Rise.

How It All Connects

One transaction boundary, five moving parts — and Rise closes the loop.

Every commission DavinTrade calculates has to end up in an affiliate's hands, somewhere in the world. Rise is the only node in this chain that makes that last step possible.

Paying a Global Affiliate Network Isn't a Feature — It's a Compliance Problem

1

Every country, different rules

KYC/AML checks, tax documentation, and local banking rails all differ by jurisdiction.

2

Currency risk on both sides

Commissions are earned in USD but owed in 90+ local currencies — someone has to absorb the conversion.

3

Manual payout doesn't scale

Batch processing, retry logic, and reconciliation are required the moment there's more than a handful of affiliates.

4

Building this ourselves means becoming a money-service business

Wallet custody, compliance registration, and settlement rails are not our core product — they're Rise's.

Why We Built Around Rise

\$650M+

Disbursed globally to date

190+

Countries supported

90+ / 100+

Local currencies / cryptocurrencies
supported

Registered

U.S. Money Service Business (FinCEN)

Rise's SIWE (Sign-In with Ethereum) wallet authentication, automated KYC/AML onboarding, and USDC/Arbitrum settlement rails are exactly the primitives our disbursement engine is already designed around — affiliates choose fiat, stablecoins, or crypto, and Rise handles the compliance underneath.

From Commission to Payout — Fully Automated

1

Customer subscribes

Via Stripe or dLocal, with a referral code applied at checkout.

2

Commission created (PENDING)

Instantly, atomically, and idempotent against webhook retries.

3

Auto-approved after 14 days

A configurable maturation window — no manual sign-off needed for the happy path.

4

Aggregated across affiliates

Batched together once a payee's approved balance crosses a \$50 threshold.

5

Batch submitted to Rise

Up to 100 payments per batch, with automatic retry on failure.

6

Rise confirms via webhook

Commission marked PAID, balances reconciled, dashboards updated in real time.

This Isn't a Concept — It's Already Built

Dedicated disbursement module

Inside our production NestJS money-service, deployed on Railway.

Provider abstraction layer

Rise is integrated behind a swappable interface, not hardcoded.

SIWE authentication client

Wired end-to-end to Rise's Sign-In with Ethereum flow.

Webhook signature verification

Implemented today; being finalized against Rise's current v2 spec.

Batch orchestration engine

Automatic retries and idempotent processing on every payout batch.

Full audit logging

Every disbursement action is logged for financial traceability.

9-page admin dashboard

Batches, transactions, accounts, audit logs, config, and health, live.

Scheduled automation

Cron jobs handle payout batching and account sync on a fixed schedule.

Built to Handle Money Correctly

HMAC-SHA256 verification on Stripe & dLocal webhooks

Both signature-verified before processing; Rise verification is being finalized against their current v2 spec.

Role-gated, JWT-authenticated admin APIs

Disbursement actions require an authenticated admin session.

KYC-gated payouts

No disbursement executes without a verified Rise account (RiseID) on file.

Full audit trail

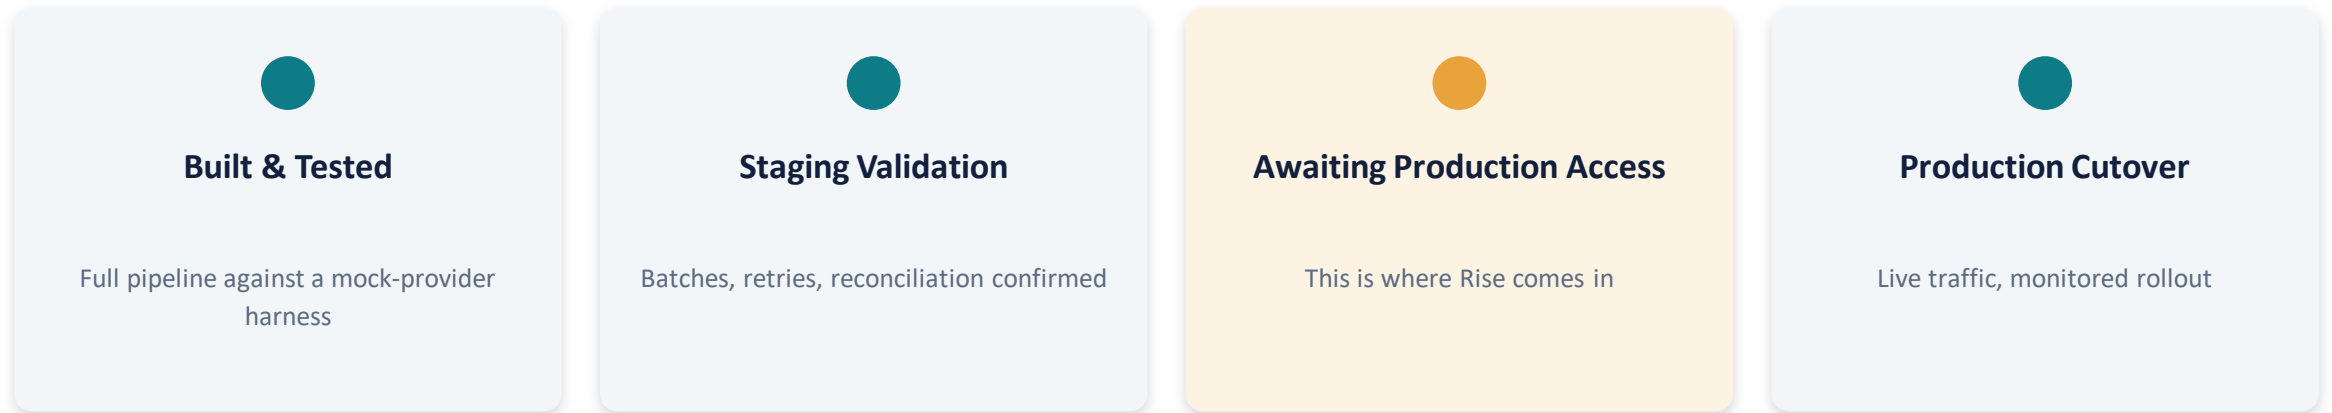

Every mutating action is written to an immutable disbursement audit log.

Rate limiting, fail-open by design

Infrastructure hiccups never block a customer checkout.

Where We Are Today

The full disbursement pipeline — batching, retries, reconciliation, admin tooling — is built and tested end-to-end against a mock-provider harness. What's left: live production access, and confirming our webhook verification matches Rise's current v2 spec.

What We Need From Rise Today

1

Enable our company for B2B API — both environments

A support request with our company name + RiseID; staging and production are enabled separately.

2

Clarity on webhooks v1 vs. v2

Your docs reference both — confirm which we should target, the current event schema, and v1's retirement timeline.

3

A production webhook signing secret, once on v2

Plus the exact signature header format, so we verify events against the right spec.

4

Batch-payment & rate limits sized for our volume

Set appropriately for our affiliate network's payout cadence.

5

A named technical contact for go-live

One point of contact to unblock issues during rollout.

Proposed Path to Production

Phase 1

Environment Enablement

Company enabled for staging + production; our API wallet authorized

Phase 2

Webhook Spec Confirmation

Confirm v2 event schema & secret; test against real signed payloads

Phase 3

Webhook Cutover

Single, reversible slice — point Rise's dashboard at production

Phase 4

Full Go-Live

Batch payouts on, with active monitoring

Why This Partnership Works Both Ways

For DavinTrade

Reliable global payouts without becoming a compliance operation ourselves

One integrated provider for fiat, stablecoin, and crypto payout preference

A disbursement pipeline already built and tested against Rise's API

For Rise

A growing, recurring-revenue affiliate network as new disbursement volume

A partner already integrated at the code level — not evaluating alternatives

A reference integration: SaaS billing plus affiliate payouts, done right

Let's Build This Together

Thank you for your time today.
