EXECUTIVE SUMMARY · PROPOSED DESIGN V0.2

DavinTrade × MetaTrader 5

Turning the trader’s own MT5 terminal into DavinTrade’s hands, connected through MCP

17 October 2026 · Owner: Davin · Status: proposed, not a build order

THE IDEA IN ONE SENTENCE

The trader’s own MT5 becomes DavinTrade’s hands. Stack D stays the brain. MCP is the wiring between them.

THE BRAIN

Stack D, unchanged

The 5-minute market analysis in DavinTrade’s cloud stays the only source of direction, zones and trade setups.

THE HANDS

The trader’s MT5

Reads the trader’s account and sends the orders the trader confirms, through their own broker.

THE WIRING

MCP

The Model Context Protocol, now built into MT5, lets software talk to the terminal directly.

WHY NOW

MT5 build 6060 removes the hardest part of the old plan

23 JULY 2026

5 → 0

pieces of per-trader infrastructure no longer needed, because MT5 now has MCP built in

April 2026 plan, per trader	With MT5 build 6060
A Windows VPS for every trader	The trader’s own PC
Python SDK plus a FastAPI bridge	Not needed: the terminal itself is the server
An inbound port open to the cloud	Nothing inbound: local connection only
Broker password stored on the VPS	Never handled by DavinTrade

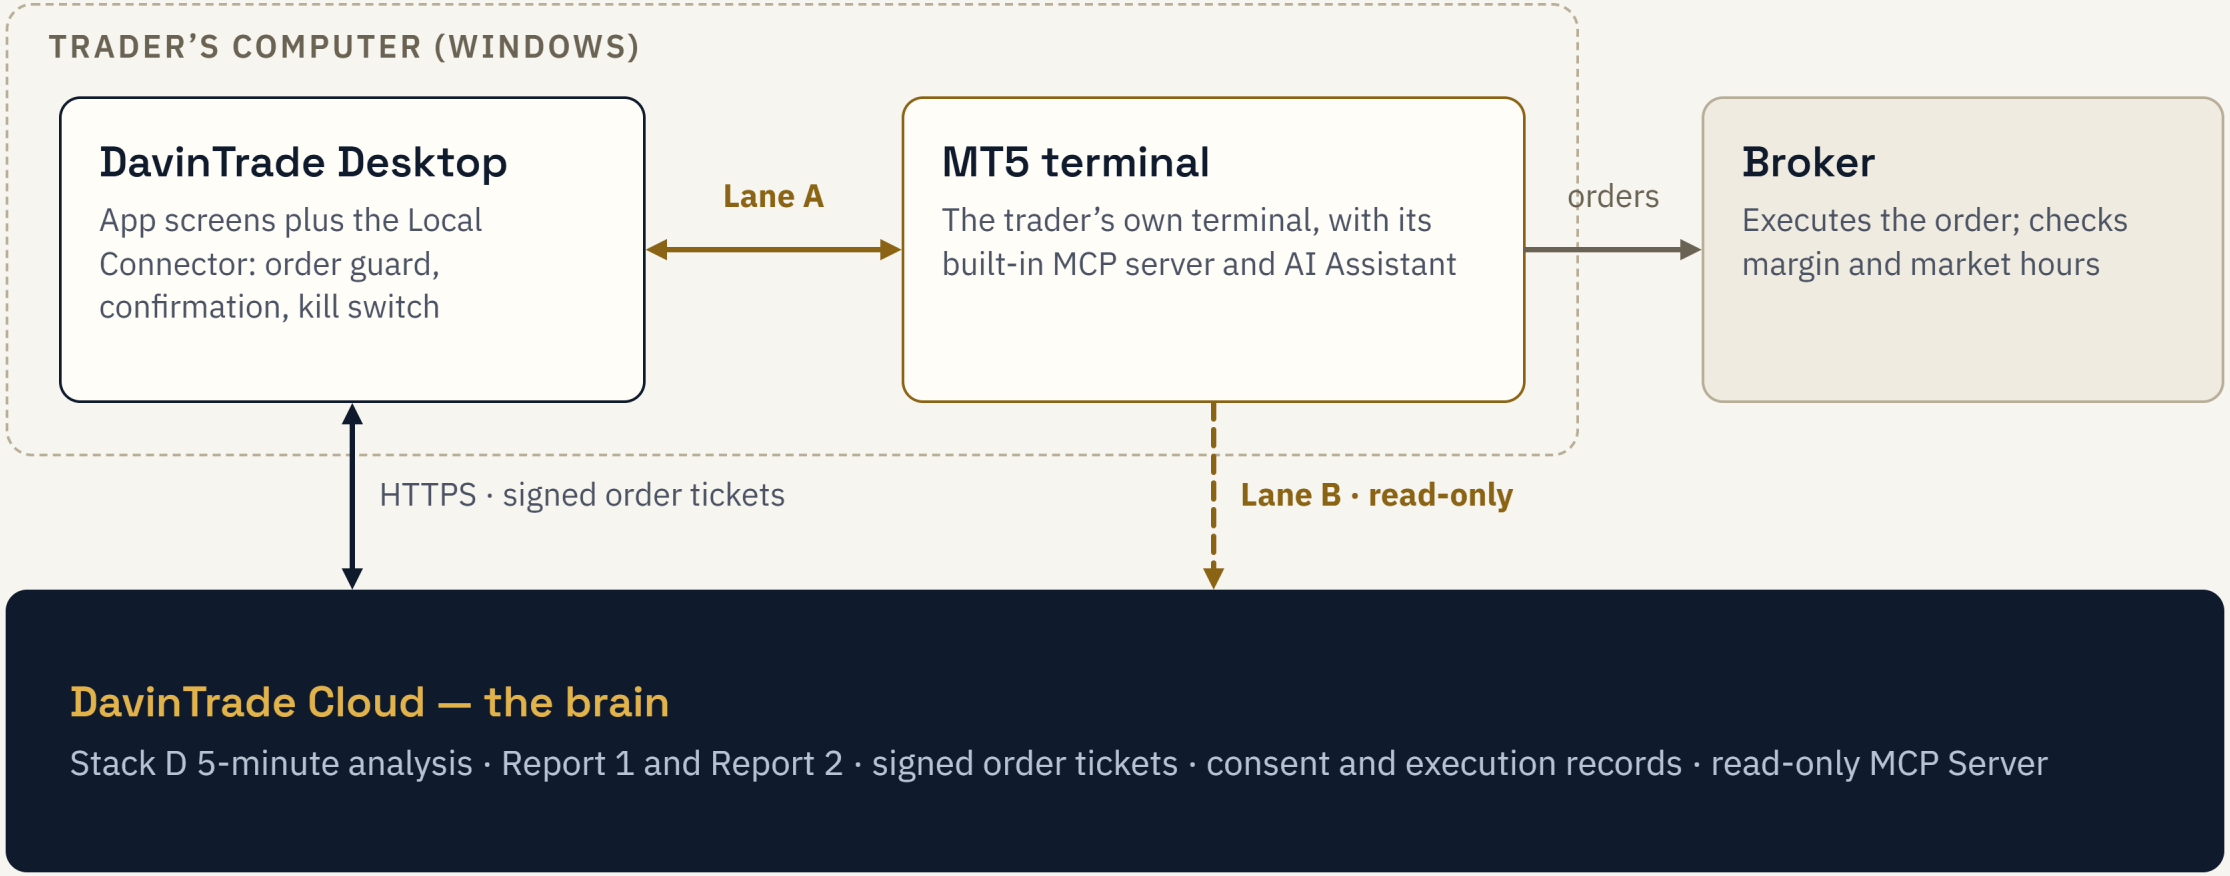

WHAT CHANGES FOR THE TRADER

From retyping numbers to one confirmed click

	Today (Stack D)	After (MT5 wrapper)
Placing the order	In MT5 by hand, retyping the Report 2 numbers	One confirmed click sends it to the trader’s own MT5
Account data	Typed into the profile by the trader	Read live from MT5, after consent
Position sizing	Uses the feed broker’s contract figures	Uses the trader’s own broker’s figures
Records	Consent records only	Plus orders sent, MT5 results and trade history
Dashboard	None for the trader’s own trades	Dashboard and reports, each trade linked to its setup

ARCHITECTURE AT A GLANCE

How DavinTrade connects to MT5

WHAT IT DELIVERS

Four capabilities: two improved, two new

1

IMPROVED

Market analysis

Same Stack D analysis, now sized with the trader's own broker figures, with their positions on the chart.

2

IMPROVED

AI trade consultant

Can discuss the trader's open position. It explains and points to setups; it never places orders.

3

NEW

Trade execution

Carries an accepted setup to MT5 after the trader confirms, then tracks expiry and results.

4

NEW

Dashboard and reports

Win rate, average R, drawdown and the outcome of every setup, built from MT5 history.

THE GOLDEN RULE

No AI model ever places an order

AI model

Talks

Explains and points to a setup. Writes no order numbers.

→

Engine 4

Calculates

Exact lot size, entry, stop and target.

→

The trader

Decides

Accepts the setup and confirms on their own PC.

→

Order guard

Enforces

12 automatic checks before every send.

→

MT5

Executes

The trader's own terminal sends it to the broker.

- Manual confirmation only at launch
- No "Bypass" mode, ever
- Demo accounts first

THE ORDER PATH

Six steps from setup to filled order

01
Accept
The trader accepts a Report 2 setup in DavinTrade.

02
Sign
The cloud issues a signed, one-time order ticket built only from that setup.

03
Check
The desktop app runs 12 guard checks and converts to the broker’s prices.

04
Confirm
The trader sees account, size, risk and DEMO or REAL in a native window.

05
Send
One call to MT5, then the result is read back to verify it.

06
Track
Record the result; cancel a pending order when its setup expires.

⚠ If the connection drops mid-send, the app checks MT5 first. It **never resends blind**, so an order is never sent twice.

SAFETY MODEL

Seven layers of protection

1	Offer check	Stack D
2	Validator and sizing	Engine 4
3	Consent	The trader
4	Order guard (12 checks)	Desktop app
5	Native confirmation	The trader, on the PC
6	MT5 trading permission	The trader, in MT5
7	Broker checks	The broker

Dark rows: new controls added by this design

1.00
lot maximum per order

1
open DavinTrade position at a time

3R
daily loss cap, then sending stops

$0.50
max gold price gap between broker and feed

Kill switch: one key stops all new orders and cancels pending ones

Starting values; Davin sets the final numbers.

DATA AND PRIVACY

Sensitive data stays on the trader's PC

Never sent to DavinTrade

The MT5 API key
Encrypted in the Windows keychain; never in logs or the cloud

Broker password and passkey
They stay inside MT5; the trader signs in there

Money figures, kept from AI
No balance, equity or profit in money ever reaches an AI model

Five consents, all off by default

#	Unlocks
C1	Read the account: positions, history, dashboard
C2	Send orders on demo accounts
C3	Send orders on real-money accounts
C4	Sync the trade journal to the cloud
C5	Let MT5's own AI read DavinTrade context

Each consent is recorded and can be withdrawn. Execution records kept 7 years (proposed).

HOW IT IS BUILT

A desktop app built mostly from what exists

REUSES

- The live web app: every screen, chart, chat and report
- Sign-in, entitlements and Pro tiers
- Engine 4’s exact maths
- All 19 languages
- Existing tests and CI

ADDS

- An Electron desktop shell, Windows first
- The Local Connector: discovery, guard, kill switch
- A native confirmation window
- A local trade journal
- A read-only MCP Server route

COSTS AND TRADE-OFFS

- About 100 MB to install
- A yearly Windows code-signing certificate
- Electron must be kept up to date
- macOS comes later

“Reuses” and “Adds” are both parts of the recommended Electron approach. Alternatives such as Tauri are compared on the next slides.

WHY A DESKTOP APP AT ALL

A web page can’t safely talk to MT5

1

MT5 only listens locally

Its MCP server answers on 127.0.0.1 and isn’t built for browser calls. Browsers block cross-site requests and now ask before a page reaches the local network.

2

Our own policy blocks it

DavinTrade’s content security policy allows no local MT5 port. Opening one would weaken protection for every visitor.

3

The key would be exposed

The MT5 API key would sit in page JavaScript. One injected script could read it and place orders.

Principle: a trusted desktop process holds the key and talks to MT5. The web page gets only a narrow, fixed set of calls, never a price, a lot size or the key.

THE TWO MAIN APPROACHES

Electron or Tauri: size against effort

Recommended · sign-off P-2

Electron

Bundles its own Chromium and Node.js. The window loads the live web app; the Connector runs in Node.

Pros

- TypeScript end to end, like the rest of the codebase
- The official MCP SDK runs natively
- Reuses the web app; screens update with every web deploy

Cons

- About 100 MB to install, since Chromium is bundled
- Must stay on a supported release; browser fixes ship as app updates

Alternative · smaller, but costlier

Tauri 2

Uses the WebView2 engine already in Windows instead of a bundled browser. The native side is written in Rust.

Pros

- About 10 MB to install
- No browser engine to ship or patch

Cons

- Connector in Rust, or a separate Node process
- A second language for a small team
- Shared TypeScript contracts and Engine 4 maths can’t be reused directly

ALSO CONSIDERED

Three other options, and why not now

Option	The idea	Why not now	Verdict
Tray-only Connector beside the browser	A small background helper; traders keep using the web app in their browser	The browser must reach a local server (prompts, cross-site rules, our policy) or go through a cloud relay that could reach every trader's PC. The confirmation still needs a native window.	Later, as a "hand-off" for web users
.NET (WPF or WinUI)	A fully native Windows app	A new language and stack; nothing shared with the existing codebase	Not recommended
Capacitor's Electron platform	The same tool as the existing mobile app	A thin, less-maintained layer on top of Electron	Use Electron directly

Recommendation (P-2, before M1): Electron, Windows first. The tray-only idea returns later so browser users can hand an order to a running Connector.

THE PLAN

A phased rollout, M0 to M6

M0 · can start now

Spike

Verify MT5's real behaviour on a demo terminal. Builds nothing.

A-0 · decision

Adopt

Davin decides whether to build the MT5 wrapper.

M1

Connect & read

Desktop app, pairing, account and positions on the chart.

M2

Dashboards

Trade journal, MT5 history import, performance reports.

M3 · needs Stack D live

Demo execution

Signed tickets, guard, confirmation, kill switch, on demo.

M4 · counsel sign-off

Real money

The live-account gate, in all 19 languages.

M5

Inside MT5

MT5's own AI reads DavinTrade context (Lane B).

M6

AI + positions

The AI consultant discusses the trader's open position.

M1 and M2 can run while Stack D goes live. Later: automatic mode, mobile alerts, macOS.

DECISIONS

Nothing to decide today

If adopted: 15 sign-offs, each taken just before the phase that needs it. Three involve money.

⚠ P-1 · before M3

DavinTrade sends orders

Only orders the trader confirms. Replaces today's "DavinTrade places no orders" rule in part.

⚠ P-6 · before M4

Real-money gate

A separate consent, opened only after a set number of filled demo orders.

⚠ P-7 · before M3

Confirmation modes

Manual only at first. Automatic later, by its own decision. Bypass never.

OTHER KEY SIGN-OFFS

A-0 Adopt the design

P-2 Electron desktop app

P-3 Analysis from the central feed only

P-5 MT5 assistant gets context, not sized setups

P-11 Execution on the Pro tier

THE WHOLE WORKFLOW

Every phase and the sign-offs that open it

1 · Prepare

No sign-off; can start now

M0 · Spike
Verify MT5 on a demo terminal

Davin's decision

A-0 · Adopt
Build the MT5 wrapper or not

2 · Connect and read

Sign-off: P-2 · P-3 · P-11

M1 · Connect & read
Desktop app,
account, positions

Sign-off: P-10 (sync)

M2 · Dashboards
Journal, history, reports

3 · Execute

⚠ **P-1** · ⚠ **P-7** + 6 more · Stack D live

M3 · Demo orders
Tickets, guard, confirm,
kill switch

⚠ **P-6** · counsel sign-off

M4 · Real money
Live-account gate

4 · Extend

Sign-off: P-4 · P-5 · P-11

M5 · Inside MT5
MT5's AI reads DavinTrade

Sign-off: P-12

M6 · AI + positions
Consultant discusses positions

⚠ involves money: Davin's explicit sign-off plus legal counsel. M1–M2 can run while Stack D goes live; stage 4 builds on M1, not on execution.

RECOMMENDED NEXT STEP

Run the M0 spike, then decide

M0 builds nothing. On a Windows PC with MT5 build 6060 or later and a demo account, it checks the facts this design rests on.

- MT5's exact tools and order features
- How terminals are found on the PC
- How MT5's "confirmation required" setting behaves
- For counsel: does sending orders change our legal position?

Output: a dated MT5 tool catalog → the facts for the adoption decision (A-0)
